For surfers: For webmasters: feasible solution. In linear programming, any set of values for the variables x_j , $j = 1, 2, \dots, n$, that (1) satisfy the set of restrictions where the b_i are numerical constants known collectively as the right-hand side and the a_{ij} are coefficients of the variables x_j , and (2) satisfy the restrictions $x_j \geq 0$.

Feasible region. In mathematical optimization, a feasible region, feasible set, search space, or solution space is the set of all possible points (sets of values of the choice variables) of an optimization problem that satisfy the problem's constraints, potentially including inequalities, equalities, and integer constraints.

Feasible and Doable. Feasible comes from faire, the French verb meaning "to do." Doable and feasible therefore originally meant literally the same thing: "capable of being done." Indeed, doable was formed with -able, the Latin-derived French ending meaning "capable of" combined, in this instance, with do, a word with roots in Old English and one of the most basic and useful of our ...

A feasible solution is always superior to an infeasible solution. The objective function and requirements are evaluated at the end of each iteration of the optimization. The OptQuest Engine uses the results of the non-linear constraints (requirements) to determine if a solution is requirement-feasible.

Feasible Solution. The intersection set of all half-planes is formed by the constraints which determine a site. This site is called the validity region or area of feasible solutions. A store has requested a manufacturer to produce pants and sports jackets. For materials, the manufacturer has 750 m² of cotton textile and 1,000 m² of polyester.

Any feasible solution in the pyramid only has 3 linearly independent active constraints, but we need at least 4 constraints to represent the pyramid. 2.1 Basic solutions in standard form. We say that an LP is in standard form if we express it as: $\min c^T x$ s.t: $Ax = b$ $x \geq 0$ Let us assume that A is a $m \times n$ matrix.

A Degenerate LP Definition: An LP is degenerate if in a basic feasible solution, one of the basic variables takes on a zero value. Degeneracy is a problem in practice, because it makes the simplex algorithm slower. Original LP maximize $x_1 + x_2 + x_3$ (1)

A Degenerate LP - Columbia University

A basic solution: A basic solution to an LP in standard form is any solution to the linear equations for any dictionary for the LP obtained by setting the non-basic variables equal to zero. A basic feasible solution: A basic feasible solution to an LP in standard form is any basic solution that is also feasible for the LP.

Interpreting Solutions. A feasible solution is a set of values for the decision variables that satisfies all of the constraints in an optimization problem. The set of all feasible solutions defines the feasible region of the problem. Most optimization algorithms operate by first trying to locate any feasible solution, and then attempting to find another (better) feasible solution that improves ...
