In this section we define the Fourier Series, i.e. representing a function with a series in the form  $\sum (A_n \cos(n \pi x / L))$  from  $n=0$  to  $n=\infty$  +  $\sum (B_n \sin(n \pi x / L))$  from  $n=1$  to  $n=\infty$ . We will also work several examples finding the Fourier Series for a function.

In this chapter we will introduce two topics that are integral to basic partial differential equations solution methods. The first topic, boundary value problems, occur in pretty much every partial differential equation. The second topic, Fourier series, is what makes one of the basic solution techniques work.

Fourier theory was initially invented to solve certain differential equations. Therefore, it is of no surprise that Fourier series are widely used for seeking solutions to various ordinary differential equations (ODEs) and partial differential equations (PDEs). In this section, we consider applications of Fourier series to the solution of ODEs and the most well-known PDEs: ...

**Applications of Fourier Series to Differential Equations**

In mathematics, a Fourier series ( $f(x) = \sum_{n=-\infty}^{\infty} c_n e^{inx}$ ) is a periodic function composed of harmonically related sinusoids, combined by a weighted summation. With appropriate weights, one cycle (or period) of the summation can be made to approximate an arbitrary function in that interval (or the entire function if it too is periodic). As such, the summation is a synthesis of another function.
