FACTORING POLYNOMIALS 1) First determine if a common monomial factor (Greatest Common Factor) exists. Factor trees may be used to find the GCF of difficult numbers. Be aware of opposites: Ex. $(a-b)$ and $(b-a)$ These may become the same by factoring -1 from one of them.

Examples of How to Factor a Trinomial (Easy Case) Check your answer using the FOIL Method to verify if the product of the two binomials gives back the original trinomial. Example 2: Factor the trinomial $x^2 - 2x - 15$ as a product of two binomials. The coefficient of the squared term is 1 so this must be the "easy" case.

When solving quadratic equations in general, first get everything over onto one side of the "equals" sign (something that was already done in the above examples). Then first check to see if there is an obvious factoring or if there is an obvious square-rooting that you can do. If not, then it's usually best to resort to the Quadratic Formula.

Solving Quadratic Equations: Picking a Method | Purplemath

Do not forget to include the GCF as part of your final answer. Step 2: Create smaller groups within the problem, usually done by grouping the first two terms together and the last two terms together. Step 3: Factor out the GCF from each of the two groups. In the second group, you have a choice of factoring out a positive or negative number.

Factoring by Grouping - Mesa Community College

A common method of factoring numbers is to completely factor the number into positive prime factors. A prime number is a number whose only positive factors are 1 and itself. For example, 2, 3, 5, and 7 are all examples of prime numbers. Examples of numbers that aren't prime are 4, 6, and 12 to pick a few.
